"We were contacted by our client who expressed an interest in having Avicci install a small certified infrastructure solution into one their properties."

Once we had surveyed the site it was clear that it didn't fall into the category of the normal installation. Normally we would install cabling into rooms using the traditional method of lifting floorboards and finding routes through loft voids and cavity walls.

This building was built in the 1800s and constructed in traditional stone block material. The floorboards were a raft of only 4 inches onto stone floor. The ceiling coving was architecturally exquisite and a delight to see but put a shiver down the spine when asked to provide a cable route from room to room.

The first floor gave us a problem that was solved with D-Line trunking. Standard 25mm and 40mm trunking was too square and our client said it looked very commercial.

D-Line provided the 30x15mm Decorative Trunking and Clip-Over corner accessories which provided us with the ability to sit this on top of the skirting and round the doors. It blended in so much that it appeared to simply make the already wide door frames just that slightly wider.

The corners also gave the trunking route a sleek finish.

"After showing the customer the route we had taken for the cabling, he actually walked past our work and we had to show him what we had done."

That was good enough for me, he hadn't spotted it during his walk around. In this case, it was all about what he didn't see, rather than what he could see"
